## Tower Defense

You are playing a tower defense game on a grid. Some cells on the grid contain impassable rocks, some contain enemy attackers and some are empty. You may place a single laser tower in an empty cell. When placed, the tower fires laser beams north, south, east and west. The beams travel until they hit a rock or to the end of the grid, destroying all the enemies in their paths. Every enemy you destroy earns you a number of points. Your final score is the total number of points from all the destroyed enemies.

## Task

Find the highest possible final score.

## Input data

The file tower.in contains two integer numbers on the first line, $\mathbf{M}$ and $\mathbf{N}$, representing the numbers of lines and columns in the grid. The second line contains two integers, $\mathbf{R}$ and $\mathbf{E}$, representing the number of rocks and the number of enemies. The following $\mathbf{R}$ lines contain pairs of integers $\mathbf{I} \mathbf{c}$ denoting the line and column coordinates of a cell containing a rock. The following $\mathbf{E}$ lines contain triplets of integers lcs denoting the coordinates of a cell containing an enemy and the number of points earned for destroying that enemy.

## Output data

The file tower.out must contain a single number, the highest possible final score.

## Limits and constraints

- $1 \leq \mathbf{M}, \mathbf{N} \leq 1,000,000,000$
- $1 \leq \mathbf{R}, \mathbf{E} \leq 100,000$
- $1 \leq \mathbf{l} \leq \mathbf{M}$ and $1 \leq \mathbf{c} \leq \mathbf{N}$ for all coordinates
- $1 \leq \mathbf{s} \leq 10,000$ for all enemy points
- There cannot be multiple objects (rocks or enemies) at the same coordinates.
- Time limit: 0.5 seconds
- Memory limit: 128 MB

## Romanian Master of Informatics

Edition, Bucharest, $20^{\text {th }}-23^{\text {rd }}$ October 2016

## Subtasks

Test cases will be scored individually.

| Subtask | Percentage of test cases | Additional input constraints |
| :--- | :--- | :--- |
| 1 | 10 | $\mathbf{M}, \mathbf{N} \leq 1,000$ <br> $\mathbf{R}, \mathbf{E} \leq 1,000$ |
| 2 | 20 | $\mathbf{R}, \mathbf{E} \leq 1,000$ |
| 3 | 30 | $\mathbf{R}, \mathbf{E} \leq 30,000$ |
| 4 | 40 | none |

Example

| tower.in | tower.out | Explanation |
| :--- | :--- | :--- |
| 1010 | 90 |  |
| 36 |  | Placing the tower at $(5,3)$ earns 90 points $(40+10+10+30)$. |
| 23 |  | Note that placing the tower at $(5,5)$ would earn more points; |
| 15 |  |  |
| 63 |  |  |
| 5 | 240 |  |
| 5 | 5 | 10 |
| 5 | 630 |  |
| 13 | 20 |  |
| 2 | 50 |  |
| 3 | 3 | 10 |
